2024

BRICS SKILLS COMPETITION

(BRICS FUTURE SKILLS & TECHNOLOGY CHALLENGE)

COLLABORATIVE ROBOT

BRICS-FS-30
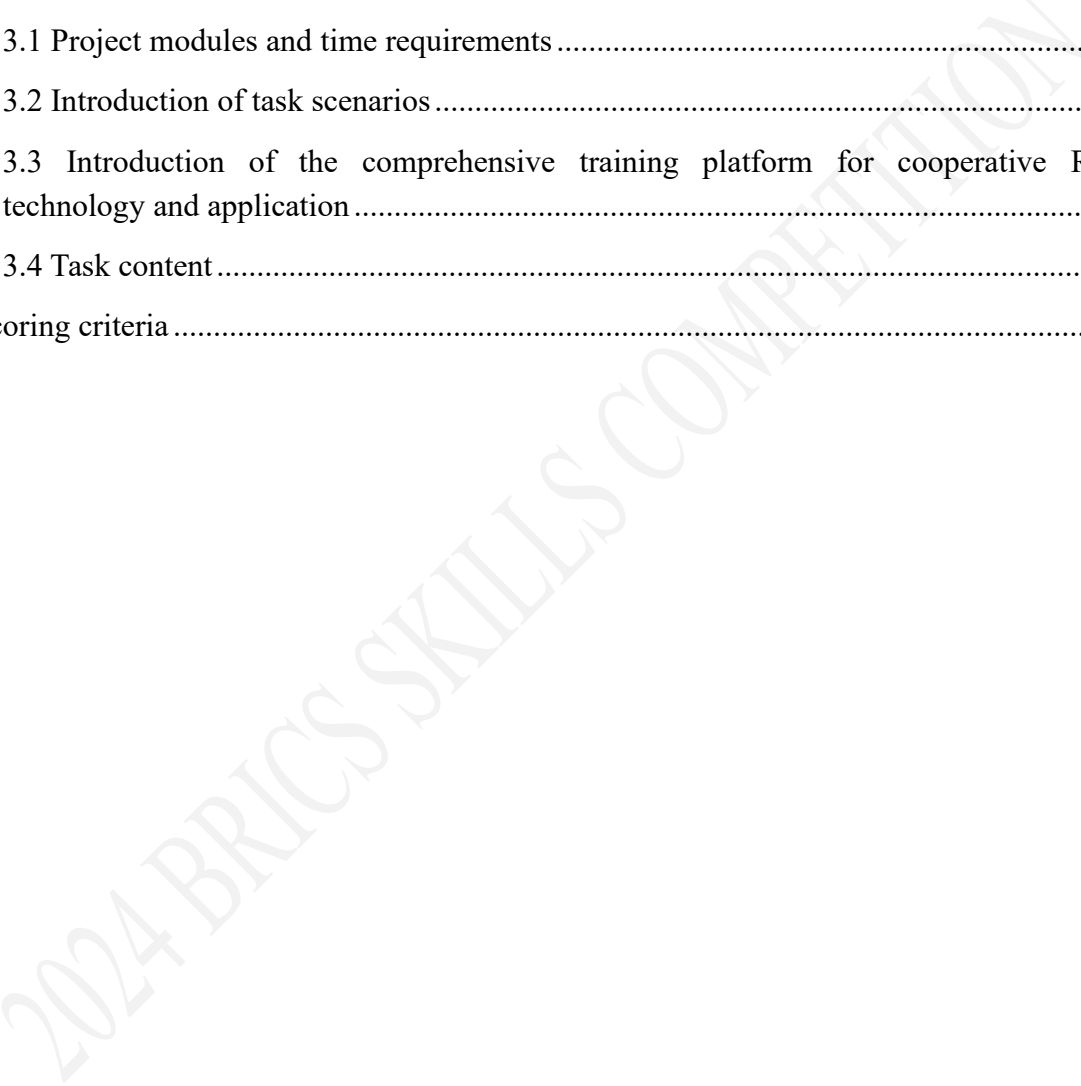

Test Project

(International Final)

July, 2024

Catalogue

1. Form of participation

Team entry (2 people).

2. Content of the competition

The competition consists of three modules, completed in order. Provide participants with task description, circuit diagram, equipment layout, equipment operation description, as well as data sources or other technical foundations required to ensure the independence and fairness of each task module. The competition includes the following task modules developed based on the application of the collaborative robot training platform:

1) Mechanical installation and cooperative robot pattern drawing

2) The cooperative robot assembly motor before handling and palletizing

3) Cooperative robot with visual Tetris

The competition assignment and scoring criteria can only be changed if the competition site is not completed and approved by the chief expert.

Competitors may be disqualified if they do not comply with occupational health and safety environment requirements, or put themselves and other players at risk.

Participants will score the results after completing the module

3. Project module and time requirements

3.1 Project modules and time requirements

The cooperative robot competition has three modules in the event, which contestants are required to complete within 12 hours. See Table 1 for the specific project module name and time requirements.

Table 1 List of item modules and time requirements

order number	Module name	Completion time of the competition content
1	Module A: Installation and debugging of the assembly and positioning platform, and cooperative robot pattern drawing	240 min
2	Module B: The cooperative robot assembles small motors before handling and palletizing	240 min
3	Module C: Cooperative robot with visual Tetris	240min

Competition Schedule

(The specific time is subject to the time announced by the organizing committee.)

Date	time	Content description
Day 1	8:00-9:00	Welcome ceremony for the contestants. Introduce the competition rules, players are familiar with the competition items, competition environment acceptance.
	9:00-9:30	Contestants collection
	9:30-10:00	The contestant accepts the competition test questions, and the chief expert introduces the competition content
	10:00-12:00	Perform "Module A: Mechanical assembly and cooperative robot trajectory coating"
	12:00-13:00	lunch
	13:00-15:00	Execution: "Module B: cooperative robot assembling small motor after handling and palletizing"
	15:00-17:00	The referee score
Day 2	9:00-9:30	Contestants collection
	9:30-10:00	The contestant accepts the competition test questions, and the chief expert introduces the competition content
	10:00-12:00	Execute "Module C: Cooperative robot with Visual Down Tetris"
	12:00-13:00	lunch
	13:00-15:00	Execution: "Module C: Cooperative robot with visual Tetris"
	15:00-17:00	The referee score
Day 3	9:00-10:00	closing ceremony

BRICS-FS-30 Collaborative Robot_Test Project

3.2 Introduction of task scenarios

Scenario 1: The company has introduced a new set of equipment, requiring technicians to assemble and color-classify the small motors. While completing the assembly and sorting of the motors, we need to learn the track exercises of collaborative robots.

Scene 2: in recent years with the development of the robot, between collaborative robot man-machine collaboration function makes collaborative robot in the service and application more widely, such as: coffee flower robot, tea robot, milk tea making robot, etc., on the basis of the game industry new development collaboration robot Russian scene, need company technical personnel to cooperate robot with visual detection debugging to complete the artificial intelligence robot under the Russian game.

3.3 Introduction of the comprehensive training platform for cooperative

Robot technology and application

1. Composition

Collaborative robot, component shelf, sorting conveyor belt, assembly positioning platform, finished material plate, disordered component material plate, excessive material plate, cooperative robot tool platform, 3D vision, 2D vision, upper computer system, programmable controller system, artificial intelligence algorithm platform, digital twin platform, etc.

3.4 Task content

Module A mechanical assembly and cooperative robot pattern drawing

The contestants shall complete the installation and debugging of the assembly and positioning platform of the collaborative robot training platform according to the task requirements. The tasks include the following contents:

1) Assembly of mechanical parts

2) Trpipe connection

3) Installation of the magnetic switch

4) Mechanical debugging

5) Pneumatic commissioning

6) Electrical debugging

Task description: This module is verified by the organizing committee for practical operation view on the collaborative robot training platform.

Task A1: Assembly and positioning platform assembly and debugging

Please assemble according to the mechanical assembly drawing, and install according to the installation location map. Please ensure that screws are fastened reliably, gas tube is inserted correctly and electrical components are installed correctly.

1. Task requirements

1) Assembly is performed according to the assembly diagram

2) Install in the correct position of the platform according to the assembly position required drawings (± 3mm)

3) Conduct the pipe and debug according to the gas diagram

4) Install and debug the position of electrical components according to the schematic diagram
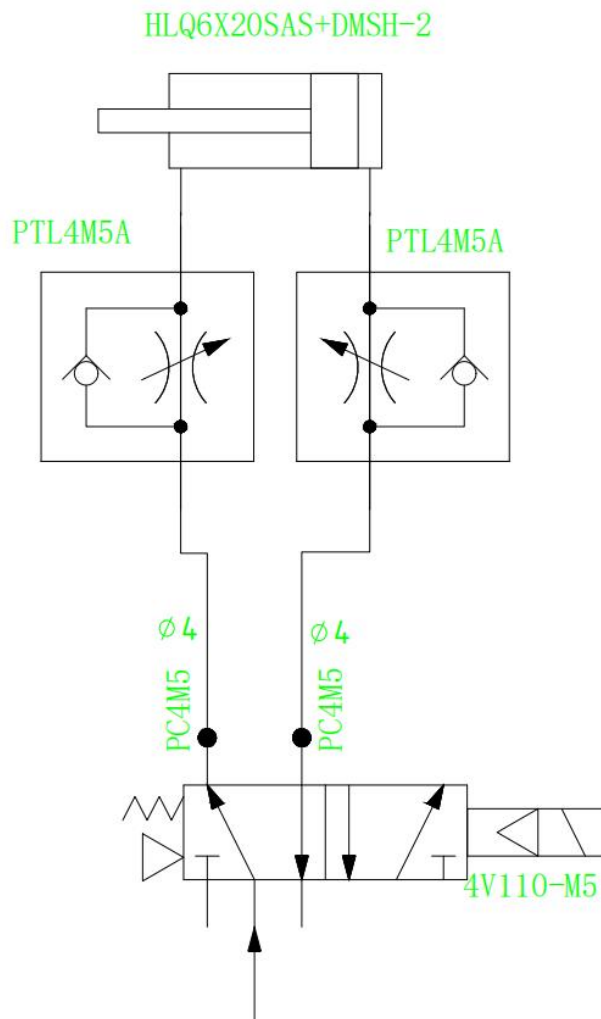

2. Pneumatic schematic diagram

Figure 3 Schematic diagram of assembly and positioning cylinder
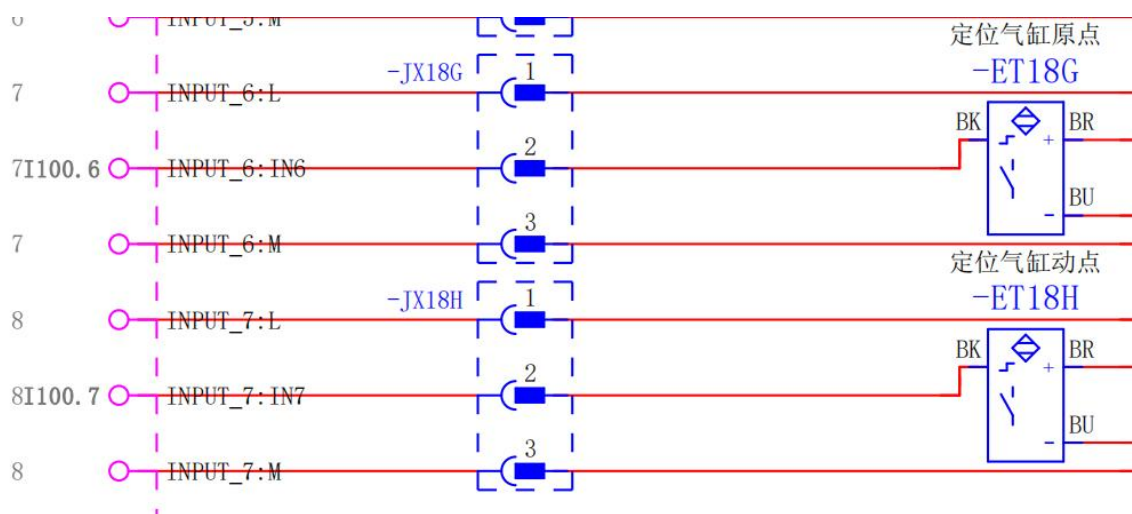

3. Electrical schematic diagram (in part)

Figure 4 Schematic of magnetic switching

Figure 6 Assembly Fig

6. Installation location requirements

Figure 7. Installation position diagram

A2 Draw the pattern and text according to the pattern of the track table, and take and put the brush tool

The contestants shall complete the robot debugging and teaching according to the task requirements, including the following contents:

1) Edit the automatic program to install the brushes;

2) The editing automatic program draws the corresponding pattern on the track table;

3) Edit the automatic program to uninstall the brushes;

Task description: This module is verified by the organizing committee for practical operation view on the collaborative robot training platform.

Task A2: automatically install the brush, draw the track pattern as shown in Figure 8, and automatically uninstall the brush

1. Automatic program flow of collaborative robot

Please use the teaching ator to program

BRICS-FS-30 Collaborative Robot_Test Project

Specific requirements:

1) The cooperative robot is started and operated at a reasonable initial position;

2) Automatically install the brush, draw the track pattern as shown in Figure 8 (purple), automatically unload the brush, there can be appropriate delay in the middle, and the whole process needs to be completed continuously in one program;

3) No mechanical collision is allowed in the middle;
2. Track pattern

DO00			vacuum chuck
DO01			Claw cylinder
DO02			quick-change connector

Module B cooperative robot assembly of small motor after handling and palletizing

The contestants shall complete the robot debugging and teaching according to the task requirements, including the following contents:

1) Automatic installation and unloading of the claw tool;

2) PLC programming;

3) Touch-screen configuration;

4) Motor bottom shell is sorted according to the color;

5) Motor assembly;

6) Finished product motor stacking;

Task description: This module is verified by the organizing committee for practical operation view on the collaborative robot training platform.

Task B 1: Motor base case according to color sorting, motor assembly, pick and release clamp tool

1. Automatic program flow of collaborative robot

Please use the teaching ator to program

Specific requirements:

1）The cooperative robot is started and operated from a reasonable initial position;

2）Automatic installation of claw tool, motor bottom shell according to the color sorting, rotor assembly, motor cover assembly, finished product stacking, there can be appropriate delay in the middle, the whole process needs to be continuously executed in a program (a total of 6 motors);

3）Design according to the touch screen design requirements;

BRICS-FS-30 Collaborative Robot_Test Project

4）No mechanical collision is allowed in the middle;

2．Touch-screen design requirements

Table 2 Design requirements for touch screen

region 1	region 2	region 3	region 4
region 5	region 6	region 7	region 8
region 9	region 10	region 11	region 12
region 13	region 14	region 15	region 16

1616 cases, cases respectively representing 16 different regions, each area requirements are as follows:

Figure 9. Touch-screen design

The indicator light is gray or white when it is not lit;

When the yellow indicator is detected yellow and the other indicator remains the initial status   The yellow indicator light is turned off after the fixed slide;

Similar with yellow when detected as red or blue.

Module C cooperative robot with visual under Tetris

The contestants shall complete the robot debugging, instruction and visual calibration according to the task requirements, including the following contents:

1) 3D camera hand-eye calibration;

2) Hand-eye calibration of 22D cameras;

3) 2D camera (bottom) production template position input;

4) 2D camera (above) production template position input;

5) Automatic extraction and release of the suction cup tool;

Task description: This module is verified by the organizing committee for practical operation view on the collaborative robot training platform.

Task C 1: Cooperative robot with visual Tetris

1. Automatic program flow of collaborative robot

Please use JSP, MVP, programming

Specific requirements:

BRICS-FS-30 Collaborative Robot_Test Project

1) Automatic installation of the suction cup tool;

2) With the cooperation of 3D camera, 2D camera (bottom) and cooperative robot, 14 (7 kinds of) disordered Tetris (Figure 19) are placed from 3D plate to 2D plate in the specified order (Figure 20);

3) With 2D camera (top) and cooperative robot, 14 (7 kinds) disordered (no superposition) are placed from the 2D material plate according to the specified order of the generator (FIG. 17);

4）Automatic unloading of the sucker tool;

5) No mechanical collision is allowed in the middle;

2. Platform profile

4. Scoring criteria

Table 10. Scoring criteria

module	detailed rules and regulations	value
A 1	1. The correct mechanism assembly meets the assembly specification (2 points); 2. The installation position of the mechanism is accurate within ± 3mm (2 points); 3. Correct tracheal insertion (2 points); 4. Correct installation position of the magnetic switch (I / O signal is correct) (2 points); 5. Cable and trachea binding positioning is beautiful and reasonable (2 points);	10
A 2	1. Automatic brush installation success (2 points); 2. Draw the trajectory respectively: {Logo 1, Logo 2, B, R, I, C, S, Z, Y, K, J} (1 + 0.5 * 10=6 points); 3. Successful automatic brush unloading (2 points); 4. The subsequent action of this module does not score after the mechanical collision in operation (refers to the impact protection of the robot);	10

BRICS-FS-30 Collaborative Robot_Test Project

B	1. Successful installation of automatic claw clip (1.5 points); 2. Successfully remove and release 6 motor bottom shells (0.5 * 12=6 points); 3. Successfully sorted 6 motor bottoms and slid into the corresponding chute (1 * 6=6 points); 4. In the process of sorting 6 motor bottoms, the touch screen lights up the corresponding color lights, and the warning lights light up the corresponding color lights (yellow bottom-yellow light, red bottom-red light, blue bottom-green light) (0.5 * 12=6 points); 5. Successfully removing and placing 6 motor bottom shells during the motor assembly process (0.5 * 12=6 points); 6. Successfully collect and assemble 6 motor rotors (0.5 * 12=6 points); 7. Successful motor assembly process, material extraction and assembly of 6 motor upper covers (0.5 * 12=6 points); 8. After the assembly, successfully put the 6 motors into the finished material plate (0.5 * 12=6 points); 9. Automatic unloading of claw clip successfully (1.5 points); 10. The subsequent action of this module does not score after the mechanical collision in operation (refers to the impact protection of the robot);	45
C	1. Automatic installation of suction cup tool (1 point); 2. Place 14 (7) disordered Tetris (Figure 19) from 3D to 2D (2 D in Figure 20) (0.5 * 28=14 points); 3. Place 14 (7 kinds) disordered (no superposition) Tetris from the 2D material plate to the feeding plate (Figure 18) according to the order specified by the generator (Figure 17) (0.5 * 28=14 points); 4. Automatic unloading of the suction cup tool (1 point);	30
D	professional quality	5
total points		100.00
